1. Regex to NFA

Apply *Thompson's construction* to get the NFA:

Figure 1: $r = (a|b)^*ab^*$

2. NFA to DFA

$$\mathbf{T1} = \epsilon\text{-closure}(1) = \{1,2,5,9,10\}$$

$$\text{move}(\mathbf{T1}, 0) = \{3\},$$

$$\epsilon\text{-closure}(3) = \{1,2,3,5,6,9,10\} = \mathbf{T2}$$

$$\text{move}(\mathbf{T1}, 1) = \{4,8\},$$

$$\epsilon\text{-closure}(4,8) = \{1,2,4,5,7,8,9,10\} = \mathbf{T3}$$

$$\text{move}(\mathbf{T2}, 0) = \{3,10\},$$

$$\epsilon\text{-closure}(3,10) = \{1,2,3,5,6,9,10\} = \mathbf{T2}$$

$$\text{move}(\mathbf{T2}, 1) = \{4,8,9\},$$

$$\epsilon\text{-closure}(4,8,9) = \{1,2,4,5,7,8,9,10\} = \mathbf{T3}$$

$$\text{move}(\mathbf{T3}, 0) = \{3,8\},$$

$$\epsilon\text{-closure}(3,8) = \{1,2,3,5,6,8,9,10\} = \mathbf{T4}$$

$$\text{move}(\mathbf{T3}, 1) = \{4,8\},$$

$$\epsilon\text{-closure}(4,8) = \mathbf{T3}$$

$$\text{move}(\mathbf{T4}, 0) = \{3,10\},$$

$$\epsilon\text{-closure}(3,10) = \mathbf{T2}$$

$$\text{move}(\mathbf{T4}, 1) = \{4,8,9\},$$

$$\epsilon\text{-closure}(4,8,9) = \mathbf{T3}$$

Transition Table

	0	1
T1	T2	T3
T2	T2	T3
T3	T4	T3
T4	T2	T3
